Preface

About This Manual

This manual describes the features of the Kameleon multi-function modules that are part of the Kameleon Media Processing System. As part of this module family, it is subject to Safety and Regulatory Compliance described in the Kameleon/2000 Series frame and power supply documentation (see the *Kameleon 2000 Series Frames Instruction Manual*).

KAM-SD-2AES-EAP

Kameleon Series Module

Introduction

This manual provides installation, operation, and configuration information for the KAM-SD-2AES-EAP Kameleon Series module.

The KAM-SD-2AES-EAP modules provides serial digital video synchronization and processing of two embedded digital audio channels.

This module features:

- Broadcast quality serial digital input and output,
- Two 48 kHz AES digital audio input streams can be demultiplexed from the SDI audio stream, processed in the Audio Processor, then multiplexed back into the SDI output stream,
- Audio and video delay, synchronization and processing amplifier,
- Powerful line-by-line VBI processing including user-configuration of active video lines for carrying data,
- Built-in 4x4 audio router for mapping audio channels to specific AES streams,
- Audio and video test signal generators,
- Hot swappable,
- 5 user-programmable E-MEM registers,
- Save/load module configuration files to a networked PC,
- SNMP monitoring capability,
- Web browser GUI (graphical user interface), and
- Support for Newton Control System and NetConfig Network Configuration application.

Note KAM-SD-2AES-EAP operation requires 2000NET Network Interface Module hardware revision 01A1 or greater with software version 3.2.2 or greater. Systems installed in the 2000T3N frame require the 2000FAN fan sled (refer to [Figure 3 on page 11](#)).

Installation

To install the Kameleon modules, perform the following steps:

1. Place the KAM-AES-R passive rear module in a rear frame slot and tighten the screws on each side of the rear module.
2. Cable the signal ports.

All Kameleon modules can be inserted and removed from a 2000 Series Kameleon Frame with power on.

Note Remove the front processing module before removing the rear I/O module.

System Requirements

For proper operation of the KAM-SD-2AES-EAP modules, the frame must be a 2000T1DNG or 2000T3NG which include the following components:

- 2000NET module (software version 3.2.2 or later recommended for full functionality)
- 2000GEN module
- Dual 130W power supplies in the 2000T1DNG frame
- Single 240W power supply and 2000FAN in the 2000T3NG frame

Frame Capacity

The 1 RU 2000T1DNG (with dual 130W power supplies, 2000NET and 2000GEN modules) frames have no Kameleon module capacity limitations.

The 3 RU 2000T3NG (single 240W p/s, 2000FAN, 2000NET and 2000GEN modules) frame can be fully populated with Kameleon modules when the 2000FAN fan sled and two power sleds are installed.

Table 1 provides the maximum Kameleon module count for frame types.

Table 1. Power, Cooling, and Module Capacity of 2000 Series Kameleon Frames

Item	2000T3NG Kameleon Frame Capacity	2000T1DNG Kameleon Frame Capacity
KAM-SD-2AES-EAP Module set	12	4

Module Placement in the 2000T3NG Kameleon Frame

There are twelve slot locations in both the front and rear of a 3 RU frame to accommodate 2000 and Kameleon Series media modules (audio/video signal handling modules). The Kameleon media modules consist of a two-module set with a front processing media module and a passive rear module that can be plugged into any of the 12 frame slot pairs. The rear modules provide the input and output interface connectors.

Installing the Front and Rear Modules

To install a KAM-SD-2AES-EAP module set in the 2000 Series frame:

1. Locate a vacant slot in the rear of the 3 RU frame ([Figure 1](#)).

Figure 1. 2000T3NG Kameleon Frame, Rear View

2. Insert the KAM-AES-R passive rear module into the vacant rear slot of the frame as illustrated in Figure 2.

3. Verify that the module connector seats properly against the midplane.
4. Using a crossblade screwdriver, tighten the two screw locks to secure the module in the frame.

5. Locate the corresponding front media slot (1 -12) in the frame. The 3 RU frame front view is illustrated in [Figure 3](#).

Figure 3. 2000T3NG Kameleon Frame, Front Slots

6. With the component side up, insert the processing module in the corresponding front slot (see [Figure 4](#)).
7. Verify that the module connector seats properly against the midplane and rear module connector.
8. Press firmly on both ejector tabs to seat the module.

Figure 4. Installing Front Media Module

Cabling

All cabling to the module is done on the KAM-AES-R passive rear module shown in [Figure 5](#).

SDI Video In

Connect SDI video with embedded audio to connector J11, labeled **V1**.

SDI Video Out

The SDI video is output at BNC connector J1, labeled **SDO**.

Figure 5. KAM-AES-R Input/Output Connectors

Power Up

The front LED indicators are illustrated in [Figure 6](#).

Figure 6. Front and Rear Module Indicator LEDs

A green Signal Present LED can be seen on the Passive Rear Module (PRM) when a valid input signal is present.

Operation Indicator LEDs

Table 2 provides a complete list of possible operating conditions and the resulting indicator status.

A red FAULT LED indicates an error situation. Table 2 describes signal output and LED indications for the various input/reference combinations and user settings.

Table 2. Indicator LEDs and Conditions Indicated

LED	Indication	Condition
Fault (red)	Off	Normal operation
	On continuously	Module has detected internal fault
	Long flash	One of the inputs is missing or is wrong standard
	Short flash	Errors present in SDI and/or AES/EBU input
COMM (yellow)	Off	No activity on frame communication bus
	Three flash/off pattern	Module Location command received from a remote control system
	Short flash	Activity present on the frame communication bus
CONF (yellow)	Off	Module is in normal operating mode
	Three flash/off pattern	Module Location command received from a remote control system
	On continuously	Module is initializing, changing operating modes or updating firmware. (When solid on along with Fault LED on, board has failed to load data.)
PWR (green)	Off	No power to module or module's DC/DC converter failed
	On continuously	Normal operation, module is powered

Note The yellow **COMM** and **CONF** LEDs are used for the module location function that is enabled using the 2000NET GUI. The module location function causes these LEDs to repeatedly flash concurrently three times followed by an off state of 900 ms duration (see [Slot Configuration on page 61](#)).

Configuration and Adjustments

KAM-SD-2AES-EAP configuration and monitoring can be performed using a web browser GUI interface or a networked Newton Control Panel. This section provides an overview of each of these controls along with the configuration parameters available with each type of control device.

Configuration Summary

The configuration parameters and monitoring functions available with the web browser interface and the Newton Control Panel are summarized in [Table 3](#). The parameter defaults, choices, ranges, and resolution are provided for each function

Table 3. Summary of KAM-SD-2AES-EAP Configuration Controls

Function	Default	Range/Choices Resolution	Web Page/ Function Name	Newton Panel
SDI In web page view selection	Summary	Summary or Detail	SDI In/ Summary or Detail radio button	N/A
Set error reporting for SDI input video	Enabled	Enabled or Disabled	SDI In/Detail View/ Check or uncheck error checkboxes	N/A
Demultiplex embedded audio from SDI in	No Extraction	No Extraction, Video In.G1 to G4	DEMUX/ Str1 & Str2 column radio button	N/A

Newton Control Panel Configuration

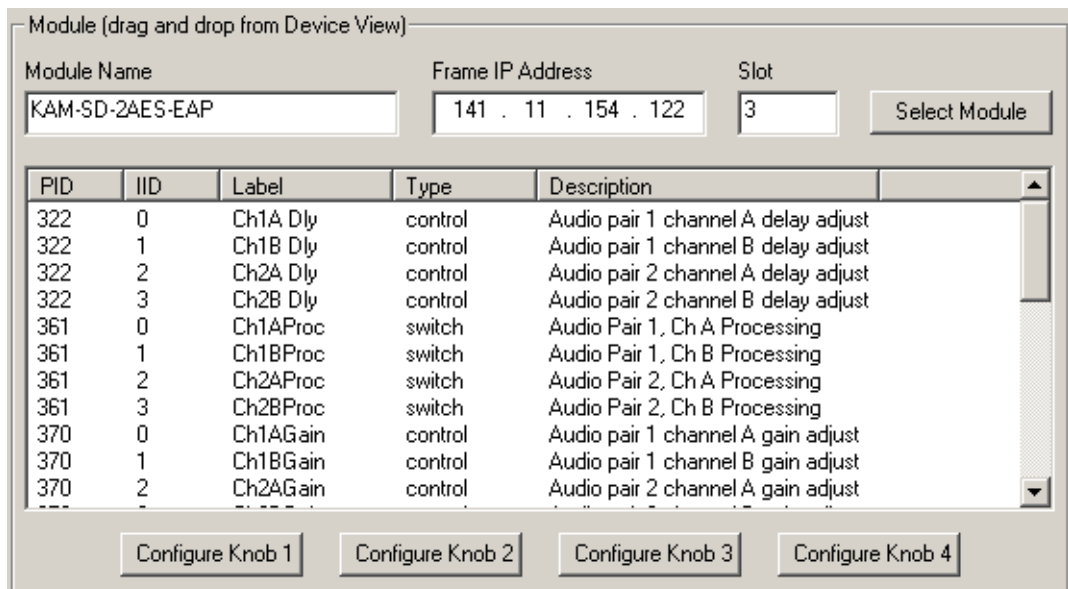

A Newton Control Panel (hard or soft version) can be interfaced to the Kameleon 2000 Series frame over the local network. Control panel access offers the following considerations for module configuration and monitoring:

- Ability to separate system level tasks from operation ones, minimizing the potential for on-air mistakes.
- Ability to group modular products—regardless of their physical locations—into logical groups (channels) that you can easily manipulate with user-configured knobs.
- Update software for applicable modules and assign frame and panel IP addresses with the NetConfig Networking application.
- Recommended for real-time control of module configuration parameters, providing the fastest response time.

Note Not all module functions are available with the control panel, such as E-MEM and factory default recalls. The available control panel controls for the module are listed in [Table 3 on page 15](#).

An example of the Newton Configurator is shown in [Figure 7](#).

Figure 7. Newton Configurator Example

Refer to the documentation that accompanies the Newton Modular Control System for installation, configuration, and operation information.

Web Browser Interface

The web browser interface provides a graphical representation of module configuration and monitoring.

Use of the web interface offers the following considerations:

- Provides complete access to all module status and configuration functions, including naming of inputs and outputs, factory parameter and name default recalls, E-MEM functions, slot configuration, and SNMP monitoring controls.
- Web access will require some normal network time delays for processing of information.
- Configuration parameter changes may require pressing the **Apply** button or **Enter**, upload processing time, and a manual screen refresh to become effective.
- Web interface recommended for setting up module signal and slot names, E-MEMS, and reporting status for SNMP and monitoring.

Refer to the Frame Status page shown in [Figure 8 on page 20](#). The Kameleon and 2000 modules can be addressed by clicking either on a specific module icon in the frame status display or on a module name or slot number in the link list on the left.

Note The physical appearance of the menu displays on the web pages shown in this manual represent the use of a particular platform, browser and version of 2000NET module software. They are provided for reference only. Displays will differ depending on the type of platform and browser you are using and the version of the 2000NET software installed in your system. This manual reflects 2000NET software version 3.2.2.

Figure 8. 2000NET GUI

The Links section lists the frame and its current modules. The selected link's Status page is first displayed and the sub-list of links for the selection is opened. The sub-list allows you to select a particular information page for the selected device.

Content display section displays the information page for the selected frame or module (frame slot icons are also active links).

Web Page Operations and Functional Elements

The following conventions and functional elements (shown at left) are used in Kameleon web page operations. (The examples shown throughout this manual represent 2000NET software version 3.2.2 or later):

- Pull-down menus allow you to choose selections from a list.
- Check boxes are used when a selection can be enabled or included in a group. Multiple check box selections or enables can be made for some parameters.
- Radio buttons are used to make a choice of one parameter in a group.
- Each numerical adjustment control has a **Coarse** adjust button (left and right top double arrows) and a **Fine** adjust button (left and right bottom single arrows).
- To change a value, use the arrow button controls or enter a value into the number field and select the **Apply** button. You may also enter a number into the number field from a keyboard and hit the **Enter** key to apply the value.
- A **Refresh** button (circular arrow) is provided for manual refresh of the web page to view recently changed parameters.
- The Status LED is explained below.

Status and Identification Header

Each configuration web page has a Status and Identification Header.

Figure 9. Typical Status/ID Header

Status LED icon

The Status LED icon reports communication status for the frame slot and is a link to the module Status web page where Warnings and Faults are displayed. LED colors indicate:

- Green = Pass – no problems detected
- Yellow = Configuration error warning
- Red = Fault condition detected

Variables:

- Model and Description are read-only generated by the module.
- Frame Location is entered in 2000 Series Kameleon Frame configuration.
- Slot number reports the module's location in the frame.
- Last Recalled E-MEM reports the last E-MEM configuration recalled from the module.

Initial Configuration Process Overview

To configure the Kameleon module proceed as follows:

1. Go to the **I/O Config** web page to setup and name inputs and outputs.
 2. If not already connected, connect all input and output signals. Go to the module **Status** web page to verify component and signal presence and condition.
 3. Go to the **Video Input Select** web page to configure the video source and output timing source.
 4. Go to the **DEMUX** web page if you are demultiplexing audio from the input signal for audio processing.
 5. Go to the **Functional View** web page to:
 - Verify the module's functional configuration is correct, and
 - Begin with the Input block links to configure each function in turn.
- Note** **Next**, **Functional View**, and **Back** links are provided to help you navigate through a logical configuration sequence.
6. Use the **MUX** web page to multiplex the processed audio back into the SDI output stream.
 7. Use **E-MEM** memory to store or recall configurations as necessary.

KAM-SD-2AES-EAP Links and Web Pages

The 2000 GUI provides the following links and web pages for the module (Figure 10):

- Status – reports input and reference signal status and module information (page 24),
- I/O Config – shows a graphic representation of inputs and outputs to the module and allows naming of each input (page 27),
- Functional View – shows a block diagram of the module with links to each configuration web page (page 29),
- Module Configuration web pages for setting up the module (beginning on page 30),
- E-MEM – provides a Standard view for Local Recall operations for up to 5 E-MEM registers (page 56) and an Advanced view providing additional **Save to** and **Load from** file operations (page 57),
- Slot Config – provides a Locate Module function and Slot Memory (page 61), and
- Software Update – allows updating of software from a CD-ROM or the web site (page 64).

The Status web page for the KAM-SD-2AES-EAP module (Figure 11 on page 25) provides an overall indication of the health of the system and links to web pages for the active components:

- Status Header – the same on all Kameleon configuration pages (see *Web Page Operations and Functional Elements* on page 21),
- Color-coded communication status for each component and path,
- Summary of all fault/warning conditions, and
- Textual module status, front module, and submodule properties.

Color-coded Status Indicators and Links

Each box represents a Kameleon module as indicated in Figure 11 on page 25. Arrows represent signal paths that may or may not be monitored. These elements act as links when their function is active (indicated by underlined function name).

Color code:

- Green = Pass – operating as expected.
- Yellow = Warning – signal is absent, has errors, or is misconfigured.
- Red = Fault – a component has failed.
- Grey = Not monitored.
- White = Not present.

Status/Front Module Properties

The Status/Front Module properties in the footer provide a textual summary of the color-coded module status. Front module properties provide hardware, firmware, software identification, and asset tag number for the KAM-SD-2AES-EAP module.

Submodule Properties

The Submodule properties in the footer provide a textual summary of the color-coded submodule status. Submodules are not supported in this module version.

Warning and Fault summary section

Warning/Fault Summary

The warnings and faults shown below are reported in the summary section of the Status web page (Figure 11 on page 25). A **Fault** indicates a serious condition that prohibits proper operation. A **Warning** indicates a condition which may or may not adversely affect operating conditions, but should be noted. Warnings may possibly be corrected by changing configuration, settings or input signals.

Warnings

- WARNING - Rear Module is not connected
- WARNING - Wrong Rear Module (incompatible with Kameleon)
- WARNING - Wrong Rear Module (no communication)
- WARNING - Wrong Rear Module (unknown type, incompatible)
- WARNING - Video Input is 625 and reference is 525 lines
- WARNING - Video Input is 525 and reference is 625 lines
- WARNING - Video Input is 625 but configuration is 525 lines

Legend:

 Present	 Not Present	 Not Monitored	 Not Available	 Unused
---	---	---	---	--

Header Row

The top header row provides the connector hardware physical label (J#) and the dedicated signal type for the connector. This information is determined by the type of rear module and front processor module installed (refer to the [Functional View Web Page on page 29](#)).

Connectors

The connector row illustrates connector type provided (BNC or 3-pin terminal) for each port. For this rear module, one serial digital video input and one serial digital output are supported.

Input/Output Mode

I/O mode is either static read-only or an operational Input/Output selection (determined by the rear module used).

Signal Name

Enter a signal name (up to 15 characters) for each operational input/output. The name will be used to identify the signal in other configuration web pages. Factory default names are shown in [Figure 12 on page 27](#).

Status

[Table 4](#) shows, by color and signal type, the signal status reports that may be displayed in the Status row for this module configuration:

Table 4. I/O Config Status Report Messages

 - [Video Input Select](#)
 - [Frame Sync](#)
 - [Video Proc](#)

Use the Functional View web page (Figure 13) to:

- Monitor module functions and signal paths, and
- Navigate to web pages for configuring active functions.

The Functional View web page is a block diagram of the installed Kameleon module that reports the module functions and signal paths that are active or inactive in the current configuration. It can be used as a link map for configuring module functions. Begin configuring with one of the input function blocks on the left.

Color coding indicates active functions and flow. Grayed components are inactive due to hardware and/or software constraints. Underlined module functions are links to the web page for that function. Return links and logical next step links are provided at the bottom of each configuration web page.

 - [I/O Config](#)
 - [Functional View](#)
 - [SDI In](#)
 - [DEMUX](#)
 - [Video Input Select](#)
 - [Frame Sync](#)
 - [Video Proc](#)

Use the DEMUX (demultiplex) web page ([Figure 17 on page 33](#)) to:

- Select which AES/EBU audio groups to extract from the incoming SDI video signal, configure in the audio processor then multiplex back into the SDI output stream.

An illustration of the possible embedded audio groups in the incoming SDI video is shown in [Figure 16](#). There are four possible groups of audio carried in an SDI video signal. Each group contains two streams of audio, AES 1 Ch 1 and Ch 2 and AES 2 Ch 1 and Ch 2. The module can demultiplex one group of audio to be processed and multiplexed back into the SDI output audio stream. The group is selected on the [Multiplex Web Page on page 47](#).

Embedded audio must be present and reported to be extracted. You may also choose to not extract audio.

Figure 16. Demultiplexing Audio Illustration

NOTE: One audio group = two streams (AES1 & 2)
One stream = two channels

Audio Demultiplexing

The presence, status, and sample rate of embedded audio in each of the four groups in the input SDI video is indicated in the table on the DEMUX web page (Figure 17).

For demultiplexing a group, do the following:

- Select **No Extraction** or the group (**G1 – G4**) to be extracted from the **Str 1 & Str 2** list with the corresponding radio button.

Use the Audio Stream Input reporting table to do the following:

- Disable the sample rate conversion if desired by checking the corresponding **Disable** checkbox.
- Turn off loss of signal reporting by unchecking the corresponding **Report** checkbox.

Figure 17. Audio Demultiplex Web Page

Model: [KAM-SD-2AES-EAP](#) Description: [Frame Sync, Proc Amp, SD/2Embed to SD/2Embed](#)

Video Input Select Web Page

Use
this
link

- [Functional View](#)
- [SDI In](#)
- [DEMUX](#)
- [Video Input Select](#)
- [Frame Sync](#)
- [Video Proc](#)
- [MUX](#)
- [VBI SDI](#)

Use the Video Input Select web page (Figure 18 on page 35) to:

- Configure input video line rate,
- Enable or disable Loss of Signal reporting to the Status web page and SNMP monitoring (refer to 2000NET manual for SNMP information),
- Configure Vertical Blanking Interval (in Advanced mode), and
- Select the output timing reference.

View Selection

In the View Selection display, choose the **Standard** radio button to display the standard settings shown in Figure 18. Use the **Advanced** view for configuring the Vertical Blanking Interval for selecting active video lines to carry data (see *Advanced VBI Configuration* on page 36).

Video Selection Settings

The following functions are provided in the Video Selection section in both the Standard and Advanced views:

- Input Name – (read-only) signal name is entered on the **I/O Config** web page
- Input Status –
 - Signal presence reported
 - Enable/disable Loss of Signal report to both Kameleon status web pages and SNMP monitoring devices.

Note The disabling of video and reference Loss of Signal reports and SDI Input Error warnings allow you to filter reports from higher level Kameleon status displays and SNMP monitoring. They will still be reported on this web page.

- Video Format – current input video format reported.
- Video Line Rate – select 525 or 625 line rate or enable automatic line rate detection
- Frame Reference –
 - 2000GEN frame reference signal presence reported,
 - Enable/disable Loss of Signal report to both Kameleon status web pages and SNMP monitoring devices.
- SDI Input Errors –
 - Input signal errors reported, and
 - Enable/disable SDI error warning report to both Kameleon status web pages and SNMP monitoring devices.

- Frame Sync/Delay – (read-only) Frame Sync mode is reported when Output Timing Selection is **Internal Frame Reference** and timing is provided from the 2000GEN module. Frame Delay mode is reported when the input signal (**Video In**) is used for timing reference.

Output Timing Selection

The 2000GEN reference module must be installed in the frame and for the Kameleon to work as a frame synchronizer, set the output timing source to **Internal Frame Reference**. Otherwise, set the output timing source to **Video In**.

Figure 18. Video Input Select – Standard View

[Back](#) [Functional View](#) [Next](#)

Advanced VBI Configuration

Advanced VBI configuration allows you extend VBI into the active picture range for special data insertion requirements. Active video lines that are used to carry data are referred to as Data Lines.

To add Data Lines to VBI:

1. Choose **Advanced (VBI Config)** on the Video Input Select web page (Figure 19).

Figure 19. Standard and Advanced View Selection

Video Input Select

Model: [KAM-SD-2AES-EAP](#) Description: [Frame Sync, Proc Amp, SD/2Embed to SD/2Embed](#)
Frame Location: [Bay 1 QA 2000 Frame](#) , Slot: [3](#)
Last Recalled E-MEM: [Factory Defaults](#)

View Selection:	<input type="radio"/> Standard	<input checked="" type="radio"/> Advanced (VBI Config)
-----------------	--------------------------------	--

The **VBI/Data Lines** panel will appear at the bottom of the web page (see [Figure 20 on page 37](#) for 525 line rate and [Figure 21 on page 37](#) for 625 line rate).

2. Select the last line (includes all previous active video lines) that will be used for data.

Selected active video lines will be shown in the **Reserved for Data** section of the web page as shown for lines 21/284 and 22/285 in [Figure 20 on page 37](#) and lines 24/337 and 25/338 in [Figure 21 on page 37](#). Lines not reserved for data will be grayed out on the VBI SDI web page ([Figure 31 on page 49](#) for 525 and [Figure 32 on page 50](#) for 625).

Active video lines that can be made available for data insertion are:

- For 525, lines 21 - 24 in Field 1, lines 284 -287 in Field 2
- For 625, lines 24 - 28 in Field 1, lines 337 -341 in Field 2

[Back](#) [Functional View](#) [Next](#)

Frame Sync Web Page

- Use this link
- [Functional View](#)
 - [SDI In](#)
 - [DEMUX](#)
 - [Video Input Select](#)
 - [Frame Sync](#)
 - [Video Proc](#)
 - [MUX](#)

Use the Frame Sync web page (Figure 22 on page 39 and Figure 23 on page 39) to:

- Adjust horizontal and vertical timing, and
- Freeze the current output or, if using a 2000GEN reference signal, select an automatic freeze mode for output when the signal is lost.

Timing Adjustment

Table 5 shows the ranges of timing adjustment for 525 and 625 signal formats.

Table 5. Timing Adjustment Ranges

Line Rate	Max Horizontal Adjustment	Max Vertical Adjustment
525/NTSC	857.5 pixels	524 lines
625/PAL	863.5 pixels	624 lines

Freeze Mode Selection

The Freeze mode controls available depend on the output timing reference selected on the [Video Input Select Web Page](#) on page 34.

When set to Frame Delay mode (using the **Video In** output timing reference), Freeze Mode allows you to manually freeze the output using **Field 1**, **Field 2**, or one **Frame** (Figure 22 on page 39). A field freeze provides less resolution and no motion artifacts in the output. In Frame mode the resolution is higher since both fields are present, but the presentation of two fields can cause motion artifacts.

Frame Sync mode (using the 2000GEN **Internal Frame Reference** as the output timing reference) provides the manual activation selections plus **AutoBlack** and **AutoFreeze** modes to be used when the video signal is lost (Figure 23 on page 39). AutoBlack outputs a black signal while AutoFreeze outputs the last complete video field.

Figure 22. Frame Synchronizer Web Page – Video In Reference

Video Processing Web Page

- Use this link
- [Functional View](#)
 - [SDI In](#)
 - [DEMUX](#)
 - [Video Input Select](#)
 - [Frame Sync](#)
 - [Video Proc](#)
 - [MUX](#)
 - [VBI SDI](#)
 - [Audio Channel Pairing](#)
 - [Audio Sync](#)
 - [Audio Proc](#)

Use the Video Proc web page to:

- Enable/disable Standard or Advanced video processing,
- Turn on Color Bars test signal,
- Enable/disable video gain lock,
- Adjust component video gain (Y, B-Y, R-Y),
- Adjust component video DC Offset (Y, B-Y, R-Y),
- Enable/disable soft and hard clipping controls, and
- Apply selected clip settings to VBI.

Video Processing Controls

Video Processing Enable

To bypass Video Processing on the SDI signal select **Disable** (Figure 24 on page 41). To make video processing adjustments to the SDI signal select **Enable** or select **Color Bars** to use the internally generated 100% vertical color bars test signal.

Two modes of video processing are available, Standard or Advanced. With **Standard** selected, only the Y Channel Video Processing controls on the left will be visible along with the clipping controls.

When **Advanced** is selected, the B-Y and R-Y Gain and Balance/Offset controls will also be displayed as shown in Figure 25 on page 43.

Standard View

In Standard View (Figure 24 on page 41), adjust the following for the Y Channel:

- Contrast/Y Gain – adjust the percentage of luminance relative to white (50 to 149.6%).
- Saturation/Chroma Gain – adjust the percentage of saturation and chroma gain relative to 100% saturation (50 to 149.6%).
- Brightness/Y Offset – adjust the amount of brightness/Y offset in mV (-3.55 to 3.44%)
- Hue/Chroma Phase – adjust the hue/chroma phase in degrees (-89.8 to 89.8 degrees).

Figure 24. Video Processing Web Page – Standard View

Model: [KAM-SD-2AES-EAP](#) Description: [Frame Sync, Proc Amp, SD/2Embed to SD/2Embed](#)
 Frame Location: [Bay 1 QA 2000 Frame](#) , Slot: [3](#)

Soft/Y Black Clip (%) <input type="text" value="-6.8"/> <input type="button" value="Apply"/>	Hard/Video Black Clip (%) <input type="text" value="-37.3"/> <input type="button" value="Apply"/>

[Back](#) [Functional View](#) [Next](#)

Advanced View

In Advanced View ([Figure 25 on page 43](#)), adjust the following for the B-Y and R-Y Channels:

Note To adjust gain for all channels simultaneously, set **Video Gain Lock** to **On**. This locks Y, B-Y, and R-Y adjustments together. Adjustment of one gain setting changes all gain values (Y, B-Y, R-Y) the same amount.

- B-Y/R-Y Gain – adjust the percentage of B-Y and R-Y gain relative to 100% (50 to 149.6%).
- B-Y/R-Y Balance/Offset – adjust the amount of B-Y and R-Y DC offset in mV (-3.55 to 3.44%)

Clipping Controls

Clipping controls are provided that affect the luminance (soft/Y) and overall saturation (hard/video) levels of the output signal.

Refer to [Figure 25 on page 43](#). To enable the clip controls select the **Enable** radio button. You may also apply the clip levels to the vertical blanking interval by checking the **Apply clips to VBI** box. This control is also available on the VBI SDI web page ([page 49](#)).

Use the following clipping controls to adjust levels on the video output:

- Use the **Soft/Y White Clip** control to set the clipping level for the top end (white) of the luminance signal (positive excursions).
- Use the **Soft/Y Black Clip** control to set the clipping level for the bottom end (black) of the luminance signal (negative spikes and Super Black).
- Use the **Hard/Video White Clip** control to set the clipping level for the top end (white) of the overall video signal (clips white and reduces overall saturation level to fit within clip).
- Use the **Hard/Video Black Clip** control to set the clipping level for the bottom end (black) of the overall video signal (clips black and reduces overall saturation level to fit within clip).

Reset To Default

Select the **Reset To Default** button on the bottom of the screen to return all values to the factory defaults.

- [Video Input Select](#)
- [Frame Sync](#)
- [Video Proc](#)
- [MUX](#)
- [VBI SDI](#)
- [Audio Channel Pairing](#)
- [Audio Sync](#)
- [Audio Proc](#)

Use the MUX (multiplex) web page to:

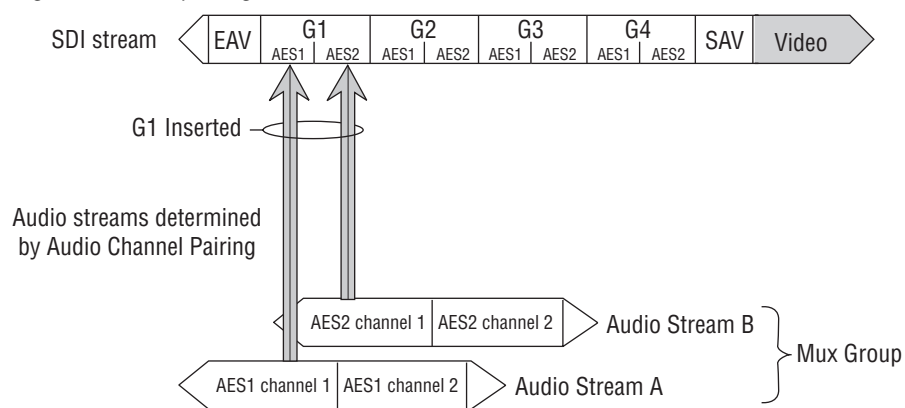

- Delete unwanted audio groups from the SDI input video signal or clear all horizontal ancillary data (HANC), and
- Insert demultiplexed audio groups that have been configured in the Audio Processor back into the SDI video stream.

Note The audio channel pairs available to each Mux Group below are determined by the Audio Channel Pairing web page (see [page 51](#)).

Note The Kameleon multiplexing circuit assumes there are no gaps between Groups in the input SDI video signal. If there are gaps, and one or more groups are inserted or replaced, all input Groups after the gap will be removed.

[Figure 26](#) depicts the multiplexing of the processed audio streams back into the SDI video stream based on the selections made on the Mux web page in [Figure 29 on page 47](#).

Figure 26. Multiplexing into the SDI Stream

One audio Group = two streams (A & B) max.
 One stream = two channels (1 & 2) max.

8343_05

The Mux web page provides two functions: Group Deletion and Group Replacement. Each of these functions depends on the presence of embedded audio groups in the incoming SDI stream and the selections made on the DEMUX web page ([DEMUX Web Page on page 32](#)).

Group Deletion

The Group Deletion area of the Mux web page reports if an embedded audio signal is present in any of the four audio groups in the incoming SDI signal and the output status of each group. It is the same as the Group Status reporting on the [DEMUX Web Page on page 32](#). It can be used to delete unwanted embedded audio groups and HANC (horizontal ancillary data) in the SDI video input signal with the following controls:

- **Delete** – check the box to delete all embedded audio in the corresponding audio group.
- **Clear all input HANC data** – check the box to delete all horizontal ancillary data in all audio groups.

The warning “24 Bit Audio in all four groups may exceed data space capabilities” may appear under the Group Deletion section when any of the following conditions occur:

- SDI Video In,
- 525 line video format,
- 24 bit audio format for Mux Group A, or
- 24 bit audio format for Mux Group B.

An example of this may be seen in [Figure 29 on page 47](#).

Group Replacement

The Group Replacement function allows the re-insertion of two processed streams (determined on the [Audio Channel Pairing Web Page on page 51](#)) into any Group (1-4) in the SDI output stream with the following controls:

- Use the **Stream A** and/or **Stream B** checkboxes in the Insert column to insert Pair 1 and/or Pair 2 into the SDI output stream.
- Select the audio Group number in the SDI stream into which to insert (embed) the streams.
- Select the output sample rate for the inserted audio as **20 bits** or **24 bits**.

An example of this may be seen in [Figure 29 on page 47](#).

Audio Multiplexing

There are four possible conditions for multiplexing as described next.

No Embedded Audio

If no embedded audio groups are present in the incoming SDI signal, the Group Deletion input status section will appear as shown in [Figure 27](#). Input Status is **Not Present** and Output Status is **Empty** for each audio group. No deletion or Group Replacement is possible with this status.

Figure 27. No Embedded Audio Present

Group Deletion

	Group 1	Group 2	Group 3	Group 4
Input Status	Not Present	Not Present	Not Present	Not Present
Delete	<input type="checkbox"/> Delete	<input type="checkbox"/> Delete	<input type="checkbox"/> Delete	<input type="checkbox"/> Delete
Output Status	Empty	Empty	Empty	Empty

Pass Embedded Audio

If an embedded audio group is present in the incoming SDI signal and has been selected for **No Extraction** on the DEMUX web page, the audio group will be passed to the output as shown in [Figure 28](#). Input Status is **Present** and Output Status is **Passed**.

Check the corresponding **Delete** checkbox to remove an audio group completely that is reported as **Present** from the SDI stream if desired. Group Replacement is not possible with this status.

Figure 28. Pass Embedded Audio

Group Deletion

	Group 1	Group 2	Group 3	Group 4
Input Status	Present	Not Present	Not Present	Not Present
Delete	<input type="checkbox"/> Delete	<input type="checkbox"/> Delete	<input type="checkbox"/> Delete	<input type="checkbox"/> Delete
Output Status	Passed	Empty	Empty	Empty

Replace Embedded Audio

An extracted audio group can be selected to replace an existing audio group with the Group replacement function as shown in [Figure 29 on page 47](#). In this case, the present audio, Group 1, has been extracted, processed in the Audio processor, and selected to replace the original audio group.

When Stream A and/or Stream B is selected in the Replace column, the Input Status will report **Present** and the Output Status will report **Replaced**. Deletion is not possible with this status.

Figure 29. Multiplex Web Page

[Back \(Video\)](#) [Functional View](#) [Next](#)
[Back \(Audio\)](#)

Insert Embedded Audio

An extracted audio group can be selected to replace an empty audio group with the Group replacement function as shown in [Figure 30](#). In this case, the original audio, Group 1, has been extracted on the [DEMUX Web Page on page 32](#), processed in the Audio processor, and selected to replace an empty audio Group.

When Stream A and/or Stream B is selected in the Replace column, the Output Status will report **Inserted** in an empty Group selected in Group Replacement.

 - [Frame Sync](#)
 - [Video Proc](#)
 - [MUX](#)
 - [VBI SDI](#)
 - [Audio Channel Pairing](#)
 - [Audio Sync](#)
 - [Audio Proc](#)

The Audio Channel Pairing web page (Figure 33) allows the input audio channels to be arbitrarily recombined into new pairs and swapped or set to **Silence**. The rows represent the audio input channels and the columns represent the audio output channels. The columns are grouped together into two different pairs (Pair 1 Ch A and Ch B and Pair 2 Ch A and Ch B).

The streams in each pair are grouped together into a Mux group on the Mux web page. Then Stream A or Stream B or both can be inserted into the SDI output video (see [MUX Web Page on page 44](#)).

Note Audio input names are assigned using the **I/O Config** web page.

Figure 33. Audio Channel Pairing Web Page

[Back \(Video\)](#) [Functional View](#) [Next](#)
[Back \(Audio\)](#)

Enable Auto Track

Select the **On** checkbox to enable auto tracking to synchronize the audio pair to the video frame sync. The amount of auto tracking applied is shown in the Auto Tracking Delay read-only display.

The total amount of delay is reported in the Total Delay read-only display for each channel.

Delay Adjustments

Each audio channel can be adjusted for delay separately or in pairs. Use the following adjustments for audio delay:

- To lock the two channels in a pair together, select the **Channel Lock** checkbox for Pair 1 or Pair 2.
- Adjust the delay for each channel with the Ch A Delay Adjust and Ch B Delay adjust controls for each pair. If the pair is locked, adjusting either control will set the delay to the same value for each channel in the pair.

Audio Processing Web Page

Use
this
link

	<input type="radio"/> 20 bit <input checked="" type="radio"/> 24 bit		

Note: Presence = > -40 dBFS, Clip = > -0.5 dBFS

[Back](#) [Functional View](#) [Next](#)

Audio Gain

Each audio channel can be adjusted for gain separately or in pairs. Use the following adjustments for audio gain:

- To lock the two channels in a pair together, select the Gain Settings **Locked** checkbox for Pair 1 and/or Pair 2.
- Adjust the gain (-40 to +6 dB) for each channel with the Ch A Gain Adjust and Ch B Gain adjust controls for each pair. If the pair is locked, adjusting either control will set the gain to the same value for each channel in the pair.

Note After gain has been adjusted, a straight quote mark (') will be added to Ch A' and Ch B' to indicate the status of the channels after gain.

Output Processing

Set the output processing for each channel with the Processing pulldown to one of the following:

- Pass
- Invert
- A+B
- A-B
- -(A+B)
- 1 kHz (test tone)
- 400 Hz (test tone)
- Silence

The Presence and Clipping status of each audio channel is reported as **True** or **False** in the read-only displays. If the audio is > -40 dBFS, it will be reported as **True**. If clipping is < 0.5 dBFS, it will be reported as **False** as shown in [Figure 35 on page 54](#).

E-MEM Configuration Web Page

 - [Audio Channel Pairing](#)
 - [Audio Sync](#)
 - [Audio Proc](#)
 - [E-MEM®](#)
 - [Slot Config](#)
 - [Software Update](#)
- Use this link →

The E-MEM page provides local operations for learning and recalling configurations into five E-MEM registers. File operations are also available for saving or loading the learned E-MEM files to and from a hard disk or other accessible media.

Factory default settings for all channels can be recalled by selecting the **Recall factory settings** button. To return the module to the factory signal names (such as the signal inputs), select the **Recall factory names** button.

There are two E-MEM view selections: **Standard** and **Advanced**.

In Standard view (Figure 36), any one of five learned E-MEMs can be recalled by selecting the corresponding **Recall** button in the Local Operations window. This will place the configuration for the entire module into that E-MEM into the KAM-SD-2AES-EAP. This change will occur immediately upon recall. The name of the last recalled E-MEM will appear in the top header of each web page for the module.

To learn an E-MEM select the **Advanced** button in the View Selection section. This will open the Advanced view (Figure 37 on page 57).

Restore factory names

The Advanced View (Figure 37) includes a File Operations section to learn a configuration into E-MEM (**Learn**), save a file to a disk location (**Save to...**) or load a file from a disk location (**Load from...**).

To learn an E-MEM:

1. Open the Advanced view.
2. When the configuration is complete for all channels on the module, type a descriptive name for the configuration into an unused E-MEM register (or overwrite an existing one).
3. Learn the E-MEM to memory by selecting the corresponding **Learn** button. All channel configurations are learned at once and stored in the same register. This register is now learned and ready for recall.

File Operations

Save File

File operations allow you to save learned configurations to a computer hard drive or other accessible media for later recall to the onboard E-MEM registers of any Kameleon module in your system.

To save to a file, first make sure you have learned the configuration, then press the **Save To...** button.

This will bring up a File Download screen similar to [Figure 38](#). Select **Save**.

Figure 38. File Download Screen

This will bring up the Save As screen as shown in [Figure 39](#). Locate or create a directory for storing the E-MEMs and select **Save**. This E-MEM register is now saved to the selected location and may be recalled as described below.

Figure 39. Save As Screen

Load File

A file may be loaded from a saved directory to a register on the E-MEM web page by selecting the **Load From...** button in the associated E-MEM register in the Advanced view. This will bring up the Load E-MEM web page ([Figure 40](#)).

Figure 40. Load E-MEM Web Page

Load E-MEM 1

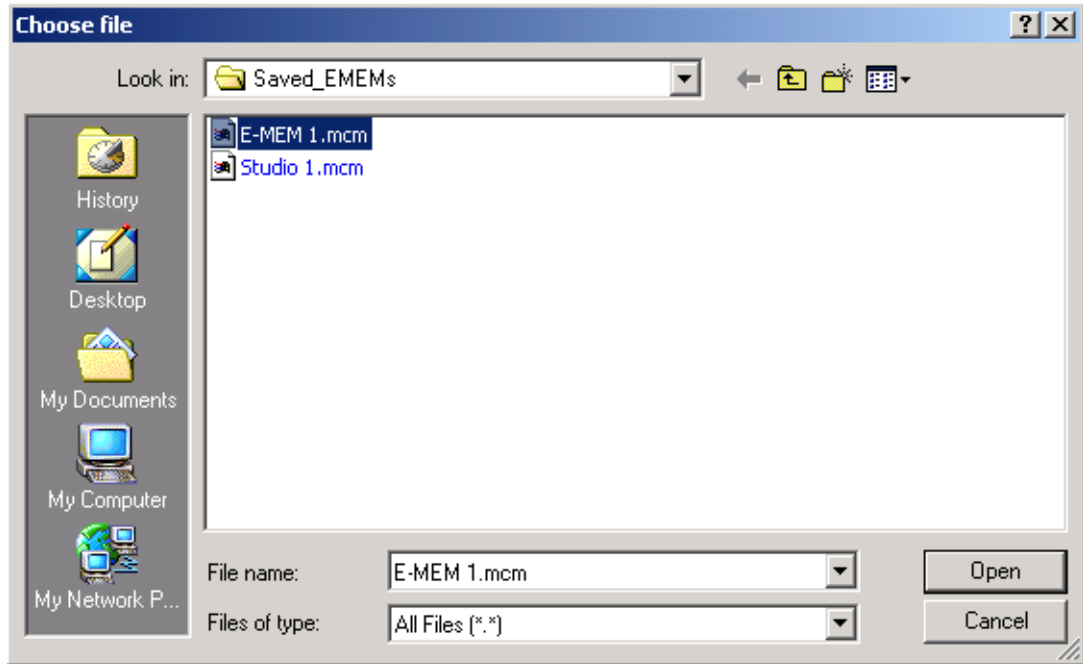

Model: [KAM-SD-2AES-EAP](#) Description: [Frame Sync, Proc Amp, SD/2Embed to SD/2Embed](#)
 Frame Location: [Bay 1 QA 2000 Frame](#) , Slot: [3](#)

Load file into E-MEM 1...

Enter filename:

Enter a path and filename or use the **Browse** button to locate your saved E-MEM files. Browse to the Choose File screen (Figure 41), select the E-MEM file to download and select **Open**.

Figure 41. Choose File Screen

This will place the path and filename in the Load E-MEM screen (Figure 40 on page 59). If this is the correct file, select **Load**. Continue to load files or select **Cancel** to return to the main E-MEM web page. Loaded files will now be entered in the associated E-MEM registers.

Select the associated **Recall** button for each E-MEM register to load the configuration to the module.

Slot Configuration

Use
this
link

- [MUX](#)
- [VBI SDI](#)
- [Audio Channel Pairing](#)
- [Audio Sync](#)
- [Audio Proc](#)
- [E-MEM@](#)
- [Slot Config](#)
- [Software Update](#)

Use the Slot Config web page (Figure 42 on page 62) to:

- Assign an appropriate name to the module slot,
- Assign an Asset Tag identification,
- Enable/disable the **Locate Module** function,
- Save module configuration and enable slot memory,
- Check SNMP related 2000NET module switch settings, and
- Enable/disable SNMP reporting for the specific Kameleon slot.

Slot Identification

You may identify the module by typing a specific name in the **Name** field. The assigned name is stored on the 2000NET module and travels with the 2000NET module if it is moved to another frame. Select **Default** to enter the factory default module name.

An asset identification may be entered in the **Asset Tag** field. This will appear on the module Status web page and in the NetConfig inventory report.

Locate Module

When enabled by selecting the **Flash** pulldown, the **Locate Module** function flashes the yellow COMM and CONF LEDs on the front of the module to make it easy to locate in the frame (see *Operation Indicator LEDs* on page 14).

Slot Memory

The slot configuration for each media module is automatically saved periodically to the 2000NET module in that frame. You may also select the **Learn Module Config** button at any time to save the current configuration for this slot. The configuration is saved on the 2000NET module. If the 2000NET module is removed or powered down, the stored configurations are not saved.

When the **Restore upon Install** box has been checked, the current configuration saved to this slot is saved as slot memory. When the current module is removed and another module of the same type is installed, the configuration saved to the 2000NET module will be downloaded to the new module. The box must be checked before the current module with the saved configuration is removed.

Note Uncheck this box before installing new software. After reconfiguring the module with the new software, select the **Learn Module Config** button.

Figure 42. Slot Configuration Web Page

Slot Config

Trap Severity	Alarm	Warning	Warning	Warning

Frame Health Reporting

The reporting of Slot Fault, Signal Loss, and Reference Loss can be enabled or disabled to the Frame Health connector on the rear of the Kameleon frame by selecting or deselecting the corresponding checkbox.

Hardware Switch Controls

This section is a read-only status report of 2000NET module switch settings for Module Status Reporting and Asynchronous Status Reporting. These functions must be enabled for the following Slot SNMP Trap Reports to function.

Slot SNMP Trap Reports

This section is displayed only when the SNMP Agent software has been installed on the 2000NET module (refer to the *2000NET Instruction Manual* for installation instructions). Slot SNMP traps can be enabled only when the hardware switches for Module Fault reporting and Asynchronous Status reporting are enabled on the 2000NET module (dipswitch S1 segment 7 and dipswitch S2 segment 1).

The enabled SNMP traps will be reported to any SNMP manager that is identified as an SNMP Report Destination in 2000NET configuration. Trap severity is read-only hard-coded information that is interpreted and responded to by the SNMP Manager software configuration.

- [Software Update](#)

The Software Update web page (Figure 43) allows you to download new software versions for the module using the FTP server method described in the 2000NET Instruction Manual available on-line.

Software may also be updated using the NetConfig Networking Application PC option available with Modular and other Grass Valley products as described in the documentation that accompanies the option.

Refer to the latest module Release Notes for complete details on how to obtain and install the latest software for this module.

Specifications

Note Specifications are subject to change without notice.

Table 6. SDI Input/Output Specifications

Parameter	Value
SDI Input	
Signal type	Serial digital video conforming to SMPTE259M 10-bit 4:2:2 component digital signal
Input impedance	75 Ω
Connector type	75 Ω BNC on rear module
Input return loss	>15 dB to 270 MHz
Common mode rejection ratio	2 V p-p to 60 Hz
Equalization	Up to 250 meters of Belden 1694A
SDI Output	
Number of outputs	1
Signal type	Serial digital video conforming to SMPTE259M 10-bit 4:2:2 component digital signal
Signal level	800 mV \pm 10%
Output impedance	75 Ω
Connector type	75 Ω BNC on rear module
DC offset	<0.5 V when terminated into 75 Ω
Output return loss	>15 dB up to 270 MHz
Jitter	Conforms to SMPTE17.12/002 <400 ps above 1 KHz
Rise/fall time	700 – 900 ps (20 – 80% amplitude)
SDI I/O Control Parameters	
Vertical blanking processing	Line by line blank

Table 7. Frame Sync/Timing Specifications

Parameter	Value
Video Frame Sync Timing Control Parameters	
Delay adjustment (main)	0 to 1 frame in 37 ns steps
Additional delay, SDI out	0 to 151 μ s in 37 ns steps

Table 8. Main Video Processing Specifications

Parameter	Value
Main Video Frame Processing Control Parameters	
Y gain	±50% in 0.4% steps, 100% default
Y offset	±3.5% of 100% white in 0.11% steps, 0% default
B-Y gain	±50% in 0.4% steps, 100% default
B-Y offset	±3.5% of 100% white in 0.11% steps, 0% default
R-Y gain	±50% in 0.4% steps, 100% default
R-Y offset	±3.5% of 100% white in 0.11% steps, 0% default
Color bars	on/off

Table 9. Multiplexing/Demultiplexing Specifications

Parameter	Value
MUX/DEMUX Performance	
Standard	SMPTE 272M A, C: Synchronous audio, 48K, 20/24 bits/sample Compatible with buffer sizes down to 48 samples
Pass through	Up to 4 groups (frame sync must be in delay mode)
Extract, retime, insert	Up to 2 groups
Delete	Up to 4 groups
Insert	Up to 2 groups
Bits/sample on inserted audio	20/24 bits, selectable
Buffer size	170 samples
DEMUX delay	1.77 ms
MUX delay	1.77 ms
Distribution	Evenly distributed, minimum of 3 samples per line, maximum of 4 samples per line except near switching lines Switch line and nearby lines (lines 4, 5, 6, 317, 318, 319 for 625; 8, 9, 10, 270, 271, 272 for 525) have 0 samples

Table 10. Audio Processing Specifications

Parameter	Value
Audio Processing	
Number of channels supported	4
Fixed Delay	0 – 5.2 sec in 20 ms steps, individual setting for each channel
Delay Tracking	Delay can be set to automatically track delay through video frame sync with fixed offset
Gain	+6 to -40dB in 0.1dB steps, individual setting for each channel.
Other processing	Selectable: Invert; L + R; L-R; -(L-R); 1 kHz; 400 Hz; Silence Individual setting for each channel.
Re-pairing	Complete flexibility to swap or recombine any input channel with any other

Table 11. Electrical Length Specifications

Parameter	Value
Electrical Length	
SDI in to SDI Out	1 line + 10 μ s
AES/EBU to SDI Out (MUX)	3.8 ms @ 48 kHz

Table 12. Environmental/Power Specifications

Parameter	Value
Environmental	
Frame temperature range	0 to 40 degrees C ambient
Operating humidity range	0 to 90% non-condensing
Non-operating temperature	-10 to +70 degrees C
Mechanical	
Frame type	2000T1DNG Kameleon Frame or 2000T3NG Kameleon Frame
Power	
Consumption	11 Watts typical

Service

The Kameleon modules make extensive use of surface-mount technology and programmed parts to achieve compact size and adherence to demanding technical specifications. Circuit modules should not be serviced in the field except to check and replace fuses.

Troubleshooting

If your module is not operating correctly, proceed as follows:

- Check frame and module power at the front edge testpoints (Figure 44).
- If power is not present, check the fuse on the +24 V input (Figure 44).
- Check for presence and quality of input signals.
- Verify that source equipment is operating correctly.
- Check cable connections.

Figure 44. Location of Module Fuse and Voltage Testpoints

Refer to [Figure 6 on page 13](#) for the location of PWR LED and [Table 2 on page 14](#) for proper LED indications.

If the module is still not operating correctly, replace it with a known good spare and return the faulty module to a designated Grass Valley repair depot. Call your Grass Valley representative for depot location.

Refer to the [Contacting Grass Valley](#) at the front of this document for the Grass Valley Customer Support Information number.
